

Assignment 4

Implement a binary tree using an array, a vector or linked list.
(Note: duplicates are allowed in a binary tree)

Store the following elements using the properties of a binary search tree.

49, 9, 59, 288, 19, 13, 888, 77, 25, 109, 55, 118, 89, 33, 1001,
18, 44, 88, 12, 24

Perform the in-order, post-order, pre-order, breadth-first traversals.

In addition to the traversals, develop software to print out the binary tree by level. Develop software to show the parent-child relationships for all the nodes of the tree.
